

Complete Index of Common Names: Supplement to Tropical Timbers of the World (AH 607)

by Nancy Ross

Preface

Since it was published in 1984, *Tropical Timbers of the World* has proven to be an extremely valuable reference to the properties and uses of tropical woods. It has been particularly valuable for the selection of species for specific products and as a reference for properties information that is important to effective processing and utilization of several hundred of the most commercially important tropical wood timbers.

If a user of the book has only a common or trade name for a species and wishes to know its properties, the user must use the index of common names beginning on page 451. However, most tropical timbers have numerous common or trade names, depending upon the major region or local area of growth; furthermore, different species may be known by the same common name.

Herein lies a minor weakness in *Tropical Timbers of the World*. The index generally contains only the one or two most frequently used common or trade names. If the common name known to the user is not one of those listed in the index, finding the species in the text is impossible other than by searching the book page by page. This process is too laborious to be practical because some species have 20 or more common names.

This supplement provides a complete index of common or trade names. This index will prevent a user from erroneously concluding that the book does not contain a specific species because the common name known to the user does not happen to be in the existing index.
